

# Syntax Analysis

# Where We Are

w	h	i	l	e		(	i	p		<		z	)	\n	\t	+	+	i	p	;
---	---	---	---	---	--	---	---	---	--	---	--	---	---	----	----	---	---	---	---	---

```

while (ip < z)
    ++ip;
  
```

# What is Syntax Analysis?

- After lexical analysis (scanning), we have a series of tokens.
- Syntax Analysis: Find the **structure** (Syntax Tree) described by that series of tokens and report **errors** if those tokens do not properly encode a structure

# Context-Free Grammars (CFGs)

- A tool for describing languages that is strictly more powerful than regular languages.
- A production form
$$A \rightarrow B_1 B_2 \dots B_n$$

A is a nonterminal  
B<sub>i</sub>'s are either terminals or nonterminals.

## Example

BLOCK  $\rightarrow$  STMT  
          | { STMTS }

STMTS  $\rightarrow$   $\epsilon$   
          | STMT STMTS

STMT  $\rightarrow$  `EXPR;`  
          | `if (EXPR) BLOCK`  
          | `while (EXPR) BLOCK`  
          | `do BLOCK while (EXPR);`  
          | `BLOCK`  
          | `...`

EXPR  $\rightarrow$  `identifier`  
          | `constant`  
          | `EXPR + EXPR`  
          | `EXPR - EXPR`  
          | `EXPR * EXPR`

# Ambiguity

- A CFG is said to be **ambiguous** if there is at least one string with two or more derivations.
- $R \rightarrow \text{int} \mid R + R \mid R - R$

# Abstract Syntax Trees (ASTs)

- Tree structure encoding the **logical structure** of a piece of code.

Example    `a = b + c`

- As the input is parsed, **associate code** creates AST with each production.
- This is called a **syntax-directed translation** or **semantic action**.

# Syntax-directed translation (in Bison)

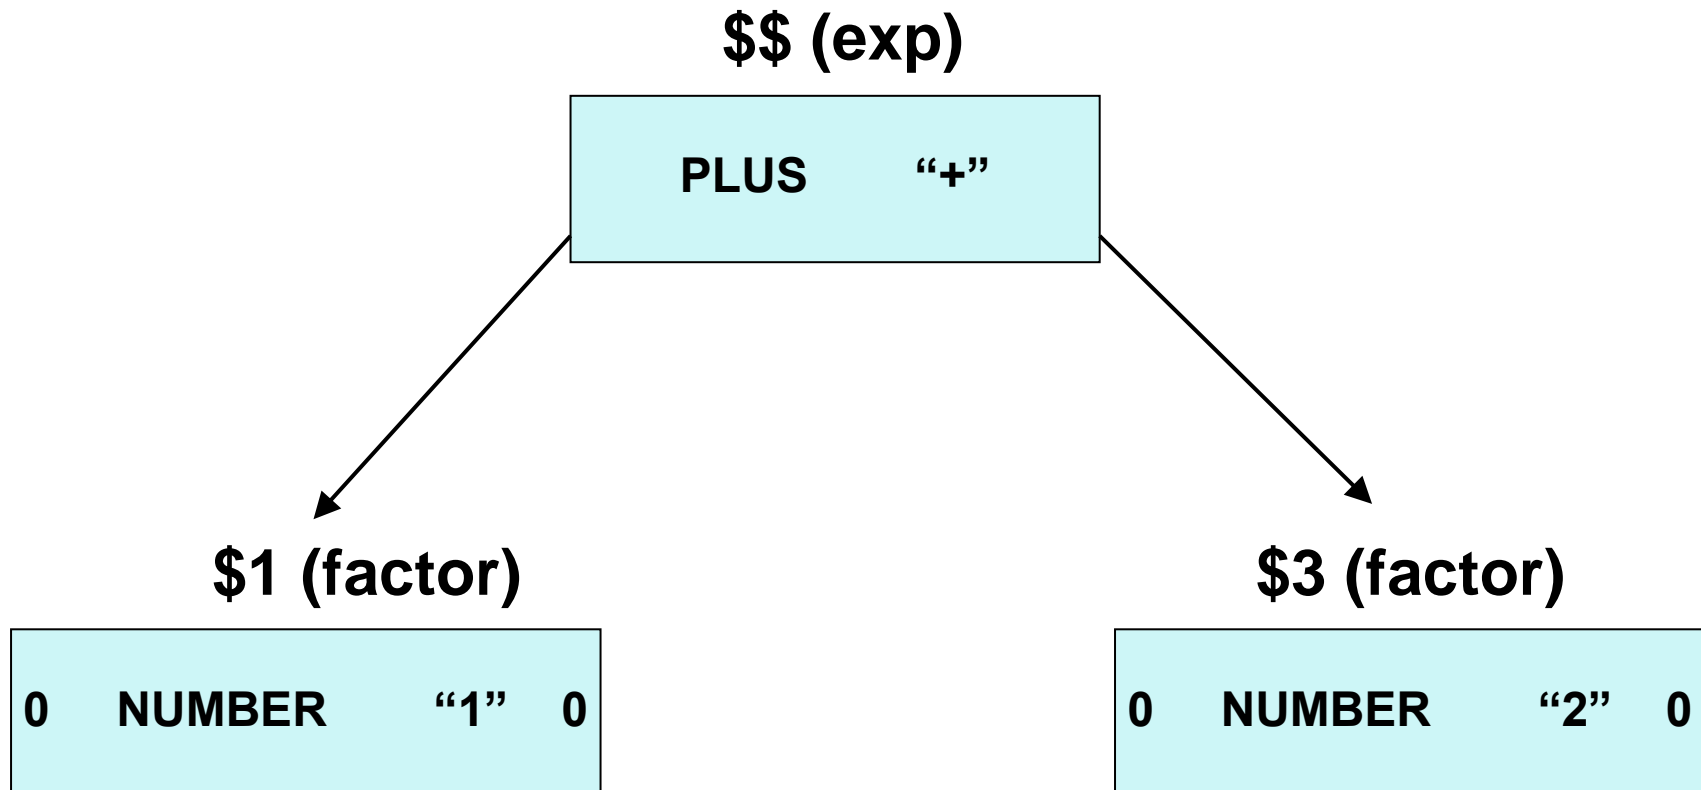

```
exp: factor { $$ = $1 }  
    | factor PLUS factor { $$ = makeNode($1, $3, PLUS, "+") }  
    | factor MINUS factor { $$ = makeNode($1, $3, MINUS, "-") }  
  
factor : NUMBER  
       { $$ = makeNode(0,0, NUMBER, (char *)yylval) }
```

Node	*Left	Token	Lexeme	*Right
------	-------	-------	--------	--------

# Syntax-directed translation (in Bison)

Example: AST for the input string “1+2”

# Top-Down Parsing

$S \rightarrow E\$$

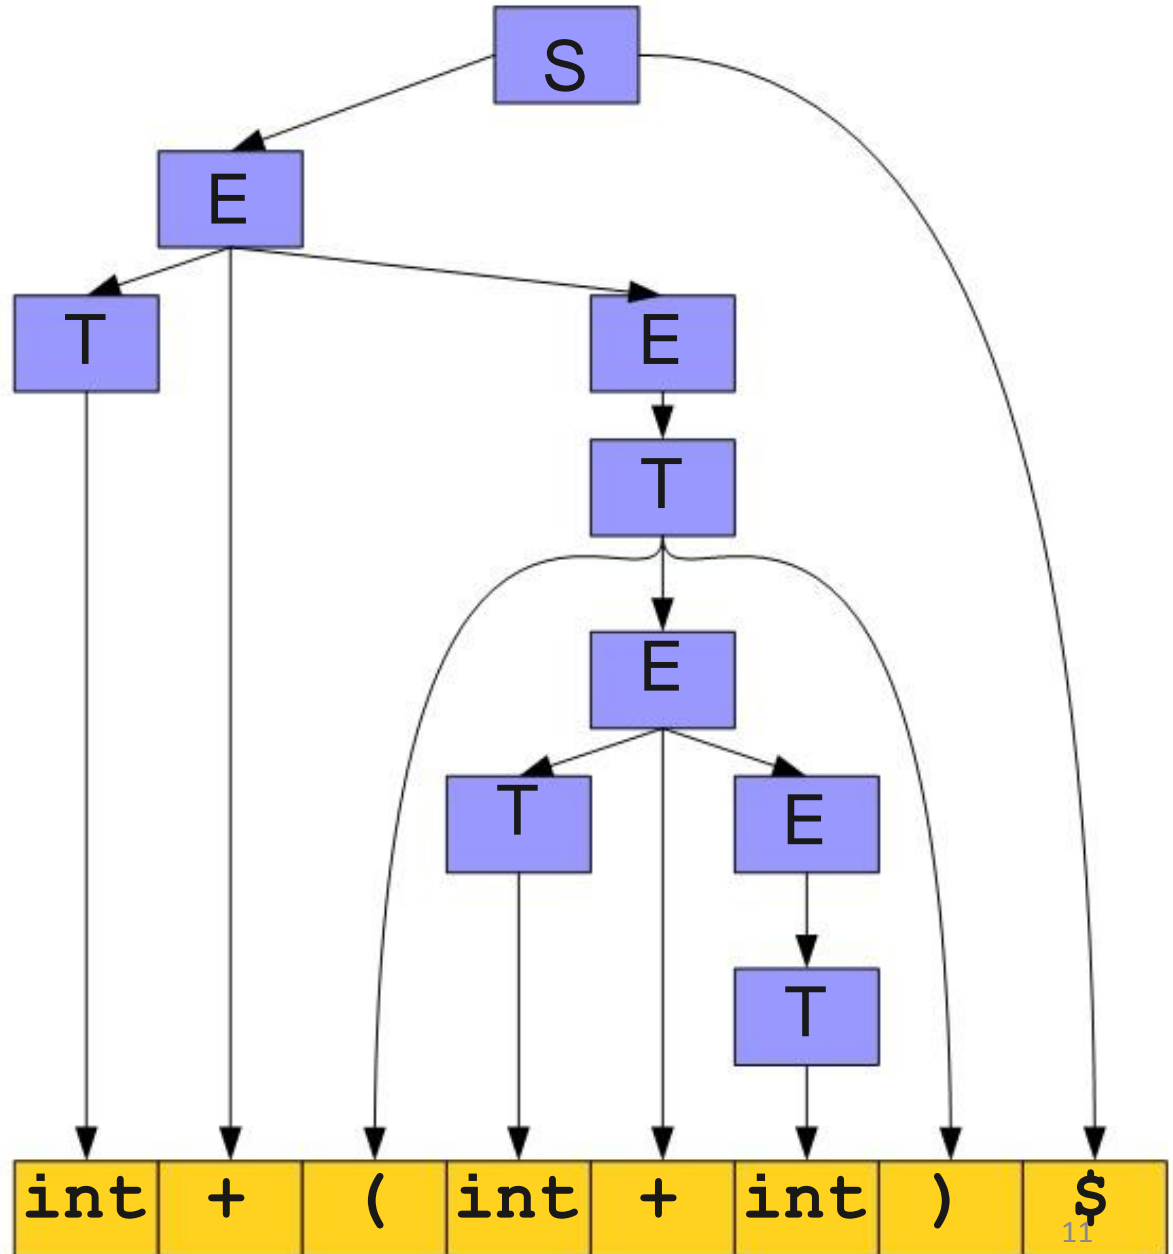

$E \rightarrow T$

$E \rightarrow T + E$

$T \rightarrow \text{int}$

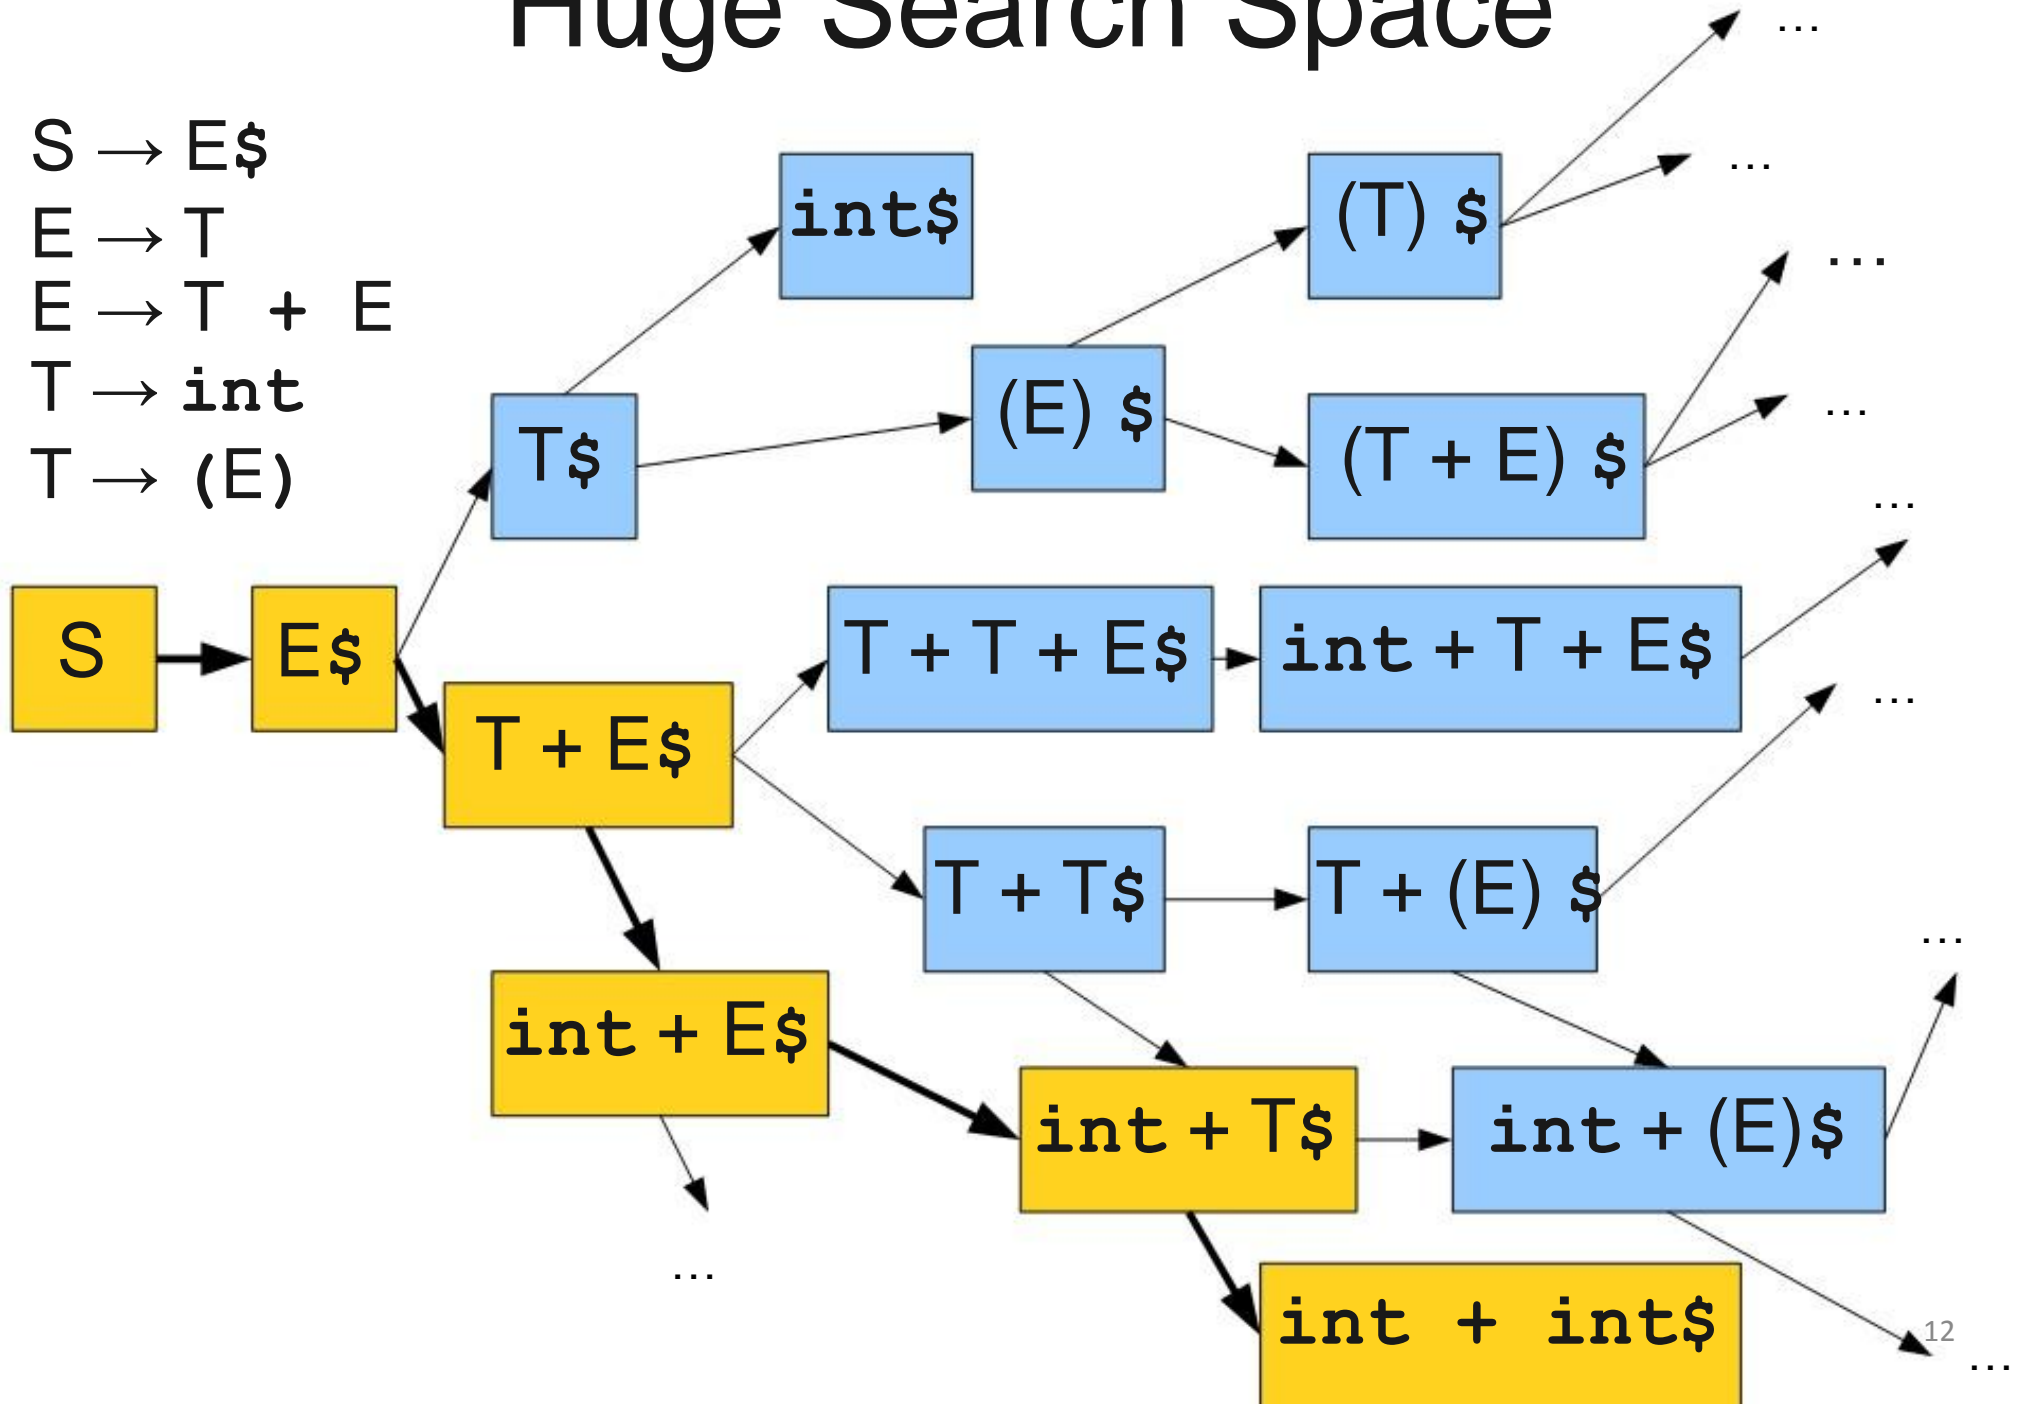

$T \rightarrow (E)$

# Top-Down Parsing

# Huge Search Space

$S \rightarrow E\$$   
 $E \rightarrow T$   
 $E \rightarrow T + E$   
 $T \rightarrow \text{int}$   
 $T \rightarrow (E)$

# BFS is Slow

- **Enormous** time and memory usage:
  - Lots of **wasted effort**:
    - Generates a lot of sentential forms that couldn't possibly match.
  - High **branching factor**:
    - Each sentential form can expand in (potentially) many ways for each nonterminal it contains.

# Predictive Parsing

- There is another class of parsing algorithms called **predictive** algorithms (no backtracking).
- Idea: **Lookahead tokens**.
- **LL(1)** : Top-down, predictive parsing
  - **L**: Left-to-right scan of the tokens
  - **L**: Leftmost derivation.
  - **(1)**: One token of lookahead
- When expanding a nonterminal, we predict the production to use by looking at the next token of the input.

# LL(1) Parse Tables

$S \rightarrow E\$$

$E \rightarrow \text{int}$

$E \rightarrow (E \text{ Op } E)$

$\text{Op} \rightarrow +$

$\text{Op} \rightarrow *$

	int	(	)	+	*	\$
S	E\$	E\$				
E	int	(E Op E)				
Op				+	*	

We will learn how to create the LL(1) parsing table soon.

# The LL(1) Algorithm

- Given an LL(1) parsing table  $T$  and input  $w$ :
- Initialize a stack containing  $S$ .
- Repeat until the stack is just  $\$$ :
  - Let the next character of  $w$  be  $c$ .
  - If the top of the stack is a terminal  $t$ :
    - If  $c$  and  $t$  don't match, report an error.
    - Otherwise consume the character  $c$  and pop  $t$  from the stack.
  - Otherwise, the top of the stack is a nonterminal  $A$ :
    - If  $T[A, c]$  is undefined, report an error.
    - Replace the top of the stack with  $T[A, c]$ .

# LL(1) Grammar

- In order to use LL(1) algorithm, our CFG grammar must be LL(1).
- We can determine which production to be used by looking at only the current token.

## Example:

STMT  $\rightarrow$  **if** EXPR **then** STMT  
| **while** EXPR **do** STMT  
| EXPR ;

EXPR  $\rightarrow$  TERM  $\rightarrow$  **id**  
| **zero?** TERM  
| **not** EXPR  
| **++** **id**  
| **--** **id**

TERM  $\rightarrow$  **id**  
| **constant**

# Constructing LL(1) Parsing Table

Table T

		Token c	
Var. A		T[A, c]	

- T[A, **c**] should be a production

$$A \rightarrow \textcolor{red}{A}_1 A_2 \dots A_n$$

if  $\textcolor{red}{A}_1$  ultimately derives something starting with **c**.

- The systematic way to filling in table entries is to use notions of **First sets** and **Follow sets**.

# FIRST Sets

- Definition:  $\text{FIRST}(A) = \{ t \mid A \rightarrow^* tw \}$ 
  - The set of tokens that appear first in the production of A.
- Set  $T[A, c] = A_1 A_2 \dots A_n$  if  $c \in \text{FIRST}(A_1)$   
and  $A \rightarrow A_1 A_2 \dots A_n$

# Computing FIRST Sets

- Initially, for each production  $A \rightarrow tw$ ,  
$$\text{FIRST}(A) = \{ t \mid A \rightarrow tw \} \quad // t \text{ is a terminal symbol}$$
- Then, for each  $A \rightarrow Bw$ , iteratively compute  
$$\text{FIRST}(A) = \text{FIRST}(A) \cup \text{FIRST}(B)$$
- When no changes occur, the resulting sets are the FIRST sets.

# Iterative FIRST Computations

# Updated FIRST Set Computation

- If  $A \rightarrow A_1 A_2 \dots A_n$  and  $A_1$  **cannot** produce  $\epsilon$ ,  
FIRST(A) contains FIRST( $A_1$ )
- If  $A \rightarrow A_1 A_2 \dots A_n$  and  $A_1$  **can** produce  $\epsilon$ ,  
FIRST(A) contains both FIRST( $A_1$ ) and FIRST( $A_2$ )
- If  $A \rightarrow A_1 A_2 \dots A_n$  and **all**  $A_i$  **can** produce  $\epsilon$ ,  
FIRST(A) contains all FIRST( $A_i$ ) and  $\epsilon$ .

# FOLLOW Sets

- Can be computed iteratively:
  - Initially, set  $\text{FOLLOW}(B) = \text{FIRST}(w) - \{\epsilon\}$  for all rules  $C \rightarrow vBw$ . *// we don't consider  $\epsilon$  in follow sets*
  - $\text{FOLLOW}(B) = \text{FOLLOW}(B) \cup \text{FOLLOW}(C)$   
if  $w$  can derive  $\epsilon$ .

# Example1

First sets

$$E \rightarrow TE'$$

$$E' \rightarrow \varepsilon \mid +E$$

$$T \rightarrow FT'$$

$$T' \rightarrow \varepsilon \mid *T$$

$$F \rightarrow \text{id} \mid ( E )$$

E	E'	T	T'	F
id	$\varepsilon$	id	$\varepsilon$	id
(	+	(	*	(

For all rule  $C \rightarrow vBw$

$$\text{FOLLOW}(B) = \text{FIRST}(w) - \{\varepsilon\}$$

$$\text{FOLLOW}(B) = \text{FOLLOW}(B) \cup \text{FOLLOW}(C)$$

if  $w$  can derive  $\varepsilon$ .

# Example1

## First sets

$$E \rightarrow TE'$$

$$E' \rightarrow \varepsilon \mid +E$$

$$T \rightarrow FT'$$

$$T' \rightarrow \varepsilon \mid *T$$

$$F \rightarrow \text{id} \mid (E)$$

E	E'	T	T'	F
id	$\varepsilon$	id	$\varepsilon$	id
(	+	(	*	(

## Follow sets

Start symbol E automatically contains \$ in its follow set.

E	E'	T	T'	F
\$	Follow(E)	+	Follow(T)	*
)		Follow(E)		Follow(T)
Follow(E')		Follow(T')		

Consider non-terminals on the Right-hand Side of the production

# Example1

## First sets

$$E \rightarrow TE'$$

$$E' \rightarrow \varepsilon \mid +E$$

$$T \rightarrow FT'$$

$$T' \rightarrow \varepsilon \mid *T$$

$$F \rightarrow \text{id} \mid ( E )$$

E	E'	T	T'	F
id	$\varepsilon$	id	$\varepsilon$	id
(	+	(	*	(

## Follow sets

E	E'	T	T'	F
\$	Follow(E)	+	Follow(T)	*
)		Follow(E)		Follow(T)
<del>Follow(E')</del>		<del>Follow(T')</del>		

We need to break two infinite cycles.

# Example1

## First sets

$$E \rightarrow TE'$$

$$E' \rightarrow \varepsilon \mid +E$$

$$T \rightarrow FT'$$

$$T' \rightarrow \varepsilon \mid *T$$

$$F \rightarrow \text{id} \mid ( E )$$

E	E'	T	T'	F
id	$\varepsilon$	id	$\varepsilon$	id
